

# *SPACE* *RACE*

**OREGON GAME  
PROJECT CHALLENGE**

## Achievements Guide

2016-2017

10<sup>th</sup> Annual Oregon Game Project Challenge

[www.ogpc.info](http://www.ogpc.info)

## INTRODUCTION

Games will be evaluated at the main event by a panel of judges consisting of community volunteers from university gamers to experienced industry professionals. Judges will assess games within five categories: Programming, Game Design, Art and Assets, Theme and Story, and Professionalism. These categories are important to any game, and we encourage teams to work to meet as many achievements as possible.

Games are scored at the main event via earning achievements. Each achievement has a point value which contributes to one of the five scoring categories.

**Standard Achievements** are counted exactly as their points are listed on the scoring sheet. Achievements can only be earned once. For multi-point achievements, teams earn the highest value based on their work. For example:

Achievement	Points	Description
Multilevel Madness	1	Have more than one level
	2	Have more than three levels

In this example, you can either earn 1 or 2 points based on your number of levels. You cannot earn both values.

Choice of game style could mean that fewer points are available. For example, a text adventure game could do well in Theme and Story, but would score poorly in Art and Assets.

**Extra Credit** achievements are scored in a different manner than the standard achievements. The first one you get is worth 4 points, the second 3, then 2, then 1, and 1. Feel free to get them all if you have the time but don't worry too much if you can't, there are far more points to get in the Standard Achievements.

Highest scoring games in single categories or across all categories will receive awards. Other awards are given based on judges' or people's choice. Teams compete only within their own middle school or high school division.

# PROGRAMMING

## Standard Achievements

### Git Gud

---

Use source control - or back up multiple versions of your source code.

Source control is a critical part of keeping track of your work, how it looks over time, and knowing who made each change. Almost every professional development group uses it to keep track of their code. Solutions like Dropbox, Google Drive, and OneDrive are an acceptable starting point and ensure that your game will survive losing that one flash drive! For advanced teams, Git, Mercurial, or TFS are more professional grade source control solutions. There is lots of documentation on these options so feel free to give them a try!

### Squash 'em Flat

---

Describe a bug you found and how you fixed it.

A bug describes a mistake in the logic of your code. It's more than just a typo. If you forget a semicolon and your code stops compiling, just add a semicolon and move on. A logic bug is specifically when you expected a variable to be in a certain state, and it wasn't. These bugs often require the programmer to make changes to their code: adding a branch of logic to handle a specific case, making sure your math is correct, or even just making sure that you're not overstepping the end of an array. The changes required to fix a logic bug are usually more complicated than a simple typo.

### Keep on Truckin'

---

Game does not crash, lock up, or experience any bugs during judging.

A well-built game should perform well, even when being watched! If the demonstrator messes up and doesn't do something right, that is not a bug. Glitching through walls, breaking the physics engine, failing to pick up an item on keypress, or causing the game to stop responding/crash are all to be avoided!

### Code It Forward

---

Code is clean, well-documented and variable/function names represent their purpose.

Clean code should be easy to read with simple names and easy-to-follow logic. This also includes comments, tabbing, semicolons, and functions that are as simple as possible (no monster functions that do everything!). Example:

```
class Actor {
    constructor() {
        // Health will be overwritten when extending
        this.health = 1;
        this.alive = true;
    }

    // Base takeDamage, will be overwritten when extending
    // If health gets too low, actor will die and be removed from
    render
    takeDamage(damage) {
        this.health -= damage;
        if (this.health < 0)
            this.alive = false;
    }
}
```

## Sharper Than Flat

---

- Game uses 3D coordinate space. 3D rendering isn't necessarily required. (The "z" coordinate should have a meaningful function.)
  - Store elements with an x, y, and z which is handled during the render function.
- Game does not use 3D, but uses a pseudo-3D method such as parallax or isometric.
  - Elements are on a single flat plane, but background elements parallax or all elements are rendered in isometric.
- Game properly layers background and foreground objects. (perhaps using "depth" or "z-index" values.)
  - All foreground and background elements are layered properly, nothing that should be part of the scenery is rendered on top of the player (unless that's part of the game)

RI, L2, Down, LI, RI

---

Use a console or hidden menu to change or view the game state for the sake of testing

Simply having a console is not enough (if you're using Unity, Unreal, or something similar that already has a console, you'll still have to do work to get this achievement). You must show custom functionality in the console that is specific to your game (again, turning off collision because your engine exposes that does not count, show us your code!). Have a cheat code to jump to different levels, have a code to give the player a pickup, or have a cheat to allow super jumps would all be great examples. You can also use this console or hidden menu system to jump to specific things you want to show the judges.

### Leaderboard

---

Include a save system, high score table, or some kind of persistent, local record of previous plays of the game.

This is pretty simple in concept, save to a file, use localStorage, or do whatever you need to do to make sure that a relaunch of your game can load in and show data from a previous play. There is no requirement of format of the save, or how many saves, or where you save to, just make sure that the game can access data from a previous play.

### Cut to the Chase

---

Show a screenshot of an early build of the game running with placeholder art.

This is also pretty simple: press the Print Screen button at some point early on so you can show the judges how your game looked at that point. There's no specific requirement for what is shown as long as it's in your game (we don't need to see code or anything like that, just the game is fine).

### Order Up

---

- Include a start menu with play and quit, as well as either options or credits. All of these must be functional.
  - When the game launches, it should show this menu before play starts. The menu can be in game, a separate scene, its own control, whatever you like as long as there's a buffer between launching the game and playing it. The play and quit options should start, play, and exit the game. The options or credits should include information about your team and your game, maybe a link to your TMS entry or to a blog, developer bios, or whatever you like.
- Have a pause menu with game settings (such as volume, gamma, difficulty) in addition to the start menu.

- This has to function as a separate menu from the start menu and you have to have both. When the game launches, it should go to the start menu, when you pause, it should go to the pause menu. There are no requirements about which specific settings we want to see as long as there are settings. Things like volume, gamma, difficulty, graphics, or key bindings, would all be fine. There are also no requirements on the number of settings to have implemented. A pause menu with the option to resume game and change volume would suffice.

## License to Win

---

Release your source code online under an open source license (i.e. GPL, MIT, CCo).

Releasing your code under an open source license is pretty simple. If you're using something like Git, make your repository public and add the license file (it's ok to steal this from somewhere, that's how the pro's do it). If you're using something that doesn't use individual source files, add the license either as a header in the file, or as a standalone file next to your game files in a .zip folder.

## Extra Credit

### Stack Overflow

---

Implement and defend using a recursive function (a function that calls itself).

A recursive function is one that calls itself. One example is a function that follows a tree to find a value, calling itself for each branch. Another very common example is Fibonacci which prints numbers like this: 1 1 2 3 5 8 13 21 34 55 89 144 233 377 610. Note that the function calls itself with a smaller number,  $n$  until it equals 0:

```
// Calculate the Fibonacci sequence to n recursively
function fibonacci(n) {
  if (n <= 2)
    return 1;
  else
    return fibonacci(n - 1) + fibonacci(n - 2);
};
```

### Programmer's Delight

---

Implement and use a real-world algorithm for pathfinding, AI, etc. (A\*, Dijkstra's, <http://bit.ly/1xTEe2b> for more info). Alternatively, use a library and write a 500-word paper about the algorithm.

There are many algorithms used frequently in programming. Algorithms like Dijkstra's and A\* are often used for pathfinding, there are a number of ways to sort values (merge sort, quicksort, and bubble sort), you could also look into machine learning, graphics, or logic. Using a library (and therefore not implementing the algorithm yourself) is fine, as long as you explain how the algorithm works in 500 words.

### Method to My Madness

---

Diagram some aspect of the game with a professional diagram (state/data flow, UML, activity diagram).

Understanding the data flow, UI flow, activity flow, or states your game has are important for keeping track of your game as it grows. They can also be used to help bring another person onto your team without needing to verbally describe everything. UML (Unified Modeling Language) is a good place to start with this one as it contains well-documented descriptions of many types of charts and diagrams you can make for your game.

### You're All in It Together

---

Game uses a server to track high scores or other statistics globally (cloud saves or accounts would work too).

This is similar to **Leaderboard**, but the saved data must go on a server somehow. Integrating with Google Drive, a database, or even a simple Node.js server that keeps track of stuff in an array are all valid methods. The server/database does not have to be persistent, we just need to see that data is being passed off to a foreign location where it will be held until requested in the same session. Don't worry if the server happens to be

running on your local machine. It's very common to have both client and server running on the same developer station when debugging.

## The Far Lands

---

Game features procedural content generation (like Minecraft's world generation, or a player model generator).

This can be achieved in several different ways: Minecraft is a great example of procedural content generation in level design, clouds can be generated procedurally, shrubbery or other plants could be generated, music could be generated, textures could be generated, the map could be generated, and pretty much anything else in the game. The big thing is, something has to come out of the generator that is unique, and it has to be an asset (or assets) that can be placed in the world and viewed by the player. Something like random player stats does enhance replayability, but is not procedural *content* generation.

# GAME DESIGN

## Standard Achievements

### Top-Down

---

Write a software requirements document.

This should include a description of the game, some information on hardware requirements (PC/Ti84+/Xbox), development software (MonoDevelop/Visual Studio), and user interface to name a few (first person/third person). Also game style, target audience, and main plot points. There are formal standards for design documents (IEEE to be specific) but we won't be enforcing anything specific. As long as you can show us that you had a document that had some design elements decided on before you started working you'll get points. If you're lost, there is lots of help online about what a requirements document should look like!

### Adaptive Design

---

Keep your requirements document updated to match your final game.

As you work on your game, you'll probably find that things will change: requirements will be replaced or removed, your story will develop, and you'll probably miss some deadlines. Show the judge which aspects of your design document changed and talk about what they were before.

### Eightfold

---

Show off a paper or other low-fidelity prototype of your game (a picture of it is okay).

This was also covered at Game Jam. For those who didn't go, make a quick-and-dirty version of your game that covers the core elements and mechanics to make sure everything plays together nicely and is fun. This should be done before development starts but can also be done as development is happening as a means of testing something out before spending the time to implement it.

### Think Tank

---

Show a diagram of at least one element of the game logic (e.g. decision tree, player progression, or flowchart)

Again, there are formal diagrams that can be used (UML has a few) or you can be a little more informal. We're just looking for proof that you thought through your game a bit and have planned how important aspects will work. Showing with a diagram how the players actions impact their progression, using a diagram to show AI logic, or even something like multiplayer networking. If there's a process required for something to work, a diagram can be used to show everything connects.

## Escalator

---

The game starts simple and introduces new features or mechanics gradually.

Most great games start the player off with a few simple features/mechanics, allow the player to get used to them, and then add more until the player has full control of every mechanic. In some games (think Skyrim or Deus Ex), the features/mechanics are introduced via a skill tree method. In some games (think Minecraft or Magicka) the features/mechanics are all available at the beginning of the game but the players aren't necessarily aware of them all and need to play for a while before they learn everything. Either method may be employed, just make sure that players aren't overwhelmed when they first start playing your game!

## Challenger Approaching

---

Explain how the game presents decisions or challenges to the player.

Every good game should have decisions. Whether it's to save a character, to learn a skill, or to move stealthy vs. loud, players should feel like they have some control over the game and that their decisions matter (you're not making a movie!). Explain how your game allows the player to make decisions or how the player can approach challenges in your game.

## Goals Achievements

---

Show screenshots from before and after a design review that highlights changes made.

If your team is keeping up to date with your design document, you should be able to recognize when you start to move away from your original goal. If this is an intentional change, update your design document to get the Adaptive Design achievement. If this is not an intentional change from your original plan, you need to take a look at what you were originally trying to accomplish and make changes to your game. When you have to make changes, show a screenshot from before and after the change to show how you made your game fit your original idea better.

## S Rank

---

The game periodically gives feedback to the player based on their performance and actions.

There are a few ways to get this achievement and they're all perfectly valid. The easiest to think about is a HUD (a health bar, map, selected ability, or sprint bar would all be examples of things you might find on a HUD) rendered on top of the game. Another option would be to adjust saturation levels as the player takes damage, gets tired/hungry/thirsty, or runs out of air, or remove saturation from the screen to indicate that there's a problem. Another method would be to have someone speaking to you over a comms device, have an NPC follow you around and talk, even put indicators on the player character themselves. We're just looking to see that the player is given some indication of what's going on in the game regardless of your specific implementation.

## Groundhog Day

---

Game allows the player to have a notably different experience on each replay.

Everyone loves a game they can come back to and play again and again. Whether your game allows the player to take a different path, to solve puzzles in a different way, or uses procedural content generation to put the player in a completely new world, if the player is able to do different things from one game to the next, you'll get the points for this one.

## Bronze Calendar

---

Create a development schedule with at least 3 concrete goals.

When your team is designing your game, it's important to consider everyone's strengths and weaknesses. There's no point in designing your game to run well on an Ouya if you don't know anyone that owns an Ouya. If you have someone that's made a platformer in GameMaker before, it might be good to consider making your game a platformer in GameMaker so you can focus on other aspects of game creation. Use this knowledge to make at least 3 concrete goals you think are achievable: "background complete by Jan 12", "saving completed by March 29", "player animation completed by Feb 13".

## Taking Aim

---

Describe the game's target audience and what decisions were made to make the game appeal to them.

Every single game has a target audience: that is, the people the game was designed for. A few examples would be “Single moms from 20-40 years old”, “retired coal miners from Alabama”, “11-18 year-olds who enjoy making games”. To make your game appeal to whatever audience you have chosen, you will probably have to make some decisions about what is appropriate for those players. Many adults are going to enjoy games that make them think, little kids will often enjoy puzzle games, and most retired coal miners probably want simple mobile games. There’s no right or wrong here, just make a convincing argument for your audience and related choices.

## Extra Credit

### Cha Cha Slide

---

The game communicates new mechanics and challenges to the player via a tutorial or similar method.

To ensure that your players know how to play your game, a tutorial or other similar method of showing the mechanics should open the game. Games like Civilization or Hearthstone have a tutorial that guides the users through exactly what to click on, where to place things, and what everything does. Some games take a more laid back approach and simply tell the player what to do and then prevent them from progressing until they complete the task without the nitty gritty guide. Either method would be fine as long as the player is walked through the various mechanics of the game.

### 42 Entertainment

---

Use a physical object as part of your game (flashdrive, QR code, etc.) that contains necessary information to complete a challenge.

There are several games that have done this such as I Love Bees, Year Zero, and Why So Serious? In these games, players had to use flashdrives, cellphones, cakes, pay phones, and all sorts of real-world devices and objects to progress in the game. For this achievement, hide a required piece of information (code, puzzle solution, description of item to pick up) on a physical item (flashdrive, QR code, SD card, even a floppy disk or something you make up) that you scatter around the main event (make sure you know where they are so you can pick them up after the event!). Be sure to have one of these items on hand so you can show the judges how this works. Also, label the physical object with your team name and table number (assigned at the main event) so that people know where to go when they find one of your objects.

## Taskmaster

---

Break development milestones into smaller tasks, and assign time estimates to each one.

**Bronze Calendar** requires you to make a few milestones. To get this achievement, you must break those milestones down into subtasks and assign a reasonable time estimate to each of them. For example, “finish movement by March 20th” might be broken down into sub tasks such as, “allow jumping on colored tiles by 3/1”, “stop sprinting when sprint bar depletes by 3/10”, and “allow backward motion when player is in ‘escape mode’ by 3/18”. This will allow your team to see progression towards your milestones and help keep your game on track.

## Strategy

---

Demonstrate how the player can use multiple approaches to solve a given problem.

To get this achievement, you must demonstrate that your game allows players the freedom to pick a playstyle or to use different skills to complete the same challenge. Think of a dungeon in Skyrim. You can fight your way through the guards using whichever method of fighting you’ve leveled, you can lockpick your way into the building and bypass everyone, or you can use stealth to sneak past everyone. These options in gameplay make the game more fun and allow people to play the game the way they want.

## Bribery

---

Get people outside the team to playtest your game. Explain challenges they faced and how you addressed them.

Playtesting is an important part of any game creation process. It allows your team to verify that the game you designed is fun, engaging, and communicates what you were trying to communicate. A good playtesting session should show you areas that need improvement, things you’ve done well, and any additions you maybe need and haven’t thought of. It’s a great way to get some feedback on your game before you have a panel of judges looking over your work and giving you a score! To get this achievement, you must explain to/show the judges what you learned from your playtest session and what you did to address what you learned.

# ART AND ASSETS

## Standard

### Maker's Touch

---

- Some of the game's graphical assets were made by the team
- All of the game's graphical assets were made by the team.

Graphical assets include everything from character sprites to menu buttons. “Some” means you need at least three or four unique assets made by you or someone on your team. Editing an asset made by someone else does not count, but, for example, making a texture for someone else's model will count toward this achievement. Note that for the upper tier you would need to make the model and the texture.

### What a Concept!

---

- Show off concept art you made for your game
  - For this part of the achievement you only need to bring your concept art to the main event and display it in some way. If some of your art wasn't implemented feel free to bring it anyway, as long as you have some art that did make it into the game.
- Post art online starting at conception and ending at production
  - This is *in addition to* displaying your concept art at the event. This can include Tumblr, DeviantArt, or a similar platform dedicated to your art and the progression of your designs, or it can just be posts on the blog your team may have made for the production of the game in general. Either is fine, but be sure to post not just your original sketches but also works in progress and finished art.

### Firebrand

---

#### Make a logo for your team and game

This is pretty self-explanatory. Your logo can be stylized typeface with some kind of art included, or you can make the whole thing from scratch. As long as you as you have one for your team and one for your game you're golden. Hint: Posting these on TMS is a good idea

## Font of Dreams

---

Use fonts other than system fonts in your game.

Default fonts include Arial, Times New Roman, Comic Sans, or pretty much anything you'll find in Word's font menu. You can use default fonts where appropriate (in a copyright statement or your credits for example) but having them in your menu or in the actual gameplay is a no-go.

## All that Glitters

---

Enhance the game with decorative visual effects (particle effects, atmospheric effects).

Have you ever sent something up in a satisfying puff of smoke, or had sparkles float around after you've cast a spell? These are the kind of effects we're looking for. It should be said, however, that any kind of gore effects not only won't count toward this achievement, but could disqualify your entry!

## Tracklist

---

- Include a soundtrack
  - Your game has a soundtrack of some kind. No need for it to be handmade.
- Include a soundtrack with 2+ tracks
  - Your soundtrack has at least two tracks. Again, you don't have to create them, but make sure they are license properly.
- Include a soundtrack with 2+ tracks *composed entirely by the team*
  - With this one we kicked it up a notch. You only need two tracks to qualify, but both of those tracks, along with any others, must be lovingly hand-crafted by you or your team.

## Foley

---

- Game has a variety of sound effects
  - Have a few different sound effects to spice up your game. Footsteps, dings and bells for checkpoints or finding important objects, explosions, birdsong, you get the drift. Does not need to be made by you.
- Game features a variety of sound effects made by team
  - Get out there and stomp, whistle, sneeze, laugh, and record your way to extra points.

## Colors of the Wind

---

Make and use your own color palette and explain your choice

A generic color palette is just a group of colors you choose, but to get this achievement you need to do more than that. Choose a type of color palette (Monochrome, Analogous, Complementary for example) and explain your choice. If you decided not to go with a typical color palette, explain why you chose the colors you did. Displaying your palette along with your concept art is a good idea.

## Extra Credit

### Shakespeare

---

Game features a significant amount of writing by the team.

This writing specifically refers to things like storyline, dialogue, character backstory, that sort of thing. Even things like signs, journal entries, and other atmospheric text count as writing. Write a story for your game and integrate it into everything the character says and does!

### Steamboat Willie

---

Game features animated graphics in multiple places

Animated graphics refers to object and/or characters with multiple frames. Just moving a sprite is not sufficient. It could be a tree moving up and down in the background, a walking animation, a bird flapping across the sky, something growing or hopping, or twirling. They can be simple, as long as they have more than one frame.

### Dimensional Shift

---

Make and use 3D models in your game (or 2D sprites generated from your 3D models)

The first part should be straightforward. Make your own 3D models and use them in your game. The second part just means that you've maybe decided to model something, but since your game is 2D you create a sprite from your model and use it in your game. This can be useful, but we'll let you figure that out on your own.

### Drums of War

---

Audio changes dynamically based on gameplay

Y'know how the music in lots of games gets really intense when you start a boss fight? That, but not just boss fights. Your audio should respond to, or be indicative of,

something that is happening or is going to happen in your game. You can make your player nervous, excited, relaxed, or many other emotions depending on how you use sound in your game.

## Talkie

---

### Use voiceovers recorded by the team

Let's hear those beautiful voices! Lend a little realism to your characters, give your game some back story, or make witty comments on how your player is progressing. There are lots of games that have not only given their character voices, but made very effective use of a narrator. If you'd rather your main character not talk, give voice to a secondary character, it could even be a parrot! Give your game a voice!

# THEME AND STORY

## Standard

### Theme Hospital

---

- Game is somewhat connected to the theme
- (bonus) Game is built completely around the theme

This is a very important achievement! The theme ought to be evident in every aspect of your game from large to small. Game objects, dialog, sprites/models, music, and level design all need to be consistent with one another and relate to space. A game that has some element of space, but isn't consistent or fully connected to space would only qualify for the first tier. This is not to say that your game can't have non-space aspects to it, for example: the game starts on Earth or has an underwater level, as long as it's clear how it relates to space. You can even go crazy here, we encourage students to find creative interpretations of the theme. The game should be truly integrated with space across theme, setting, story, music, and visuals. If you can show how space is used in all aspects of your game, you'll get the higher tier.

### Storytime

---

Game communicates a story of some sort.

Everyone loves a good story. Pick something that sounds interesting to your team and include the story in your game. You'll again have to ensure that the story is evident in all aspects of your game, but as long as there is a story and it's integrated into gameplay, we don't care what the story is. Laser cats on Mars, ninjas in space, or the tales of Elon Musk, have fun and be creative!

### Exposition

---

Game environments contain information about the story

Ever had to collect all the pictures to learn the backstory of a particular character? Or maybe you've wandered around a dark forest collecting notes and avoiding the most slender of men? For this achievement, you should have items in your game that mean something and contribute to the story. It can be notes, vases, statues, debris, or any other item as long as it adds to the story and requires the player to find them.

## Detail-Oriented

---

Story is revealed progressively via cutscenes or meaningful player/NPC interactions.

Rather than putting all of your story at the beginning or end of your game, players should be led through the story as they play. Cut scenes, NPC dialog, an internal monolog, radio chatter, or even forced dialog trees are great examples of ways the story can be told progressively. Don't mix up this achievement with **Exposition**. Having elements to find is great, but for this achievement we want the player to be presented with the story smoothly blended into the player experience.

## Ludonarrative

---

Theme is expressed through gameplay (the player's actions must reflect the theme).

This is similar to **Theme Hospital**, but focuses more on player actions. Does the player's choice to sneak past the guards say something about space? Maybe the player can explore a space terminal to save the princess. Space should be evident in all aspects of your game and the player's actions and decisions are not exempt. Make sure everything the player does is related to space!

## Far Far Away

---

- Game takes place in a well-defined setting.
- (bonus) Game takes place in a well-defined setting that features varied environments or areas (Minecraft is a good example)

The setting of a game is very important (especially when the theme could be interpreted as a setting) and should be something your team spends some time on. The players should be able to easily determine where they're currently playing, whether on a planet, in space, on a ship, or wherever your game takes place. Varied environments would be something like biomes in Minecraft. The idea is that your game has more than one setting for players to explore which helps keep your players engaged through the whole experience of your game. Your varied environments could be independent levels, separate areas in one level, or the same area in a level but different textures and/or models. Guacamelee day/night levels are a good example of using the same level but still having a varied environment.

## E for Everyone

---

Game is family-friendly

This is one of the most important achievements. We cannot allow teams to demo games that show blood, gore, sexually explicit material, politically charged content, or anything else that would warrant anything above an E10+ rating for your game. If your game contains explicit material, we cannot allow you to show your game, art, paper prototype, or whatever else you bring that contains explicit material. You can still show off your code, talk through your design process, and other kid-friendly materials, but you will lose out on a lot of points. If your game is determined to contain explicit material, an OGPC official will have to ask you to put away the offending material.

NOTE: A game may contain mature themes (death, desperation, abandonment, loneliness) while still being appropriate.

### Exoskeleton

---

Create a detailed outline for your game's story.

This could be in your design document or another document you've already made, but should be an overview of your story including major plot points and other key decisions. There's no strict length or word count, as long as you've covered everything important and can walk a judge through your story, you've done everything you need to do.

### Curly Braces

---

Game has a clear beginning, middle, and end.

Every good story starts somewhere, guides you along as the characters grow and the story is revealed, and ends somewhere else. The who, what, when, where, and how of your story are completely up to you. Just make sure your story starts somewhere, has some progression, and ends somewhere else. Story writing is a very creative process, and we don't want to impose too much on the creative process. If you can argue your beginning, middle, and end to a judge you'll be fine.

## Extra Credit

### Plot Thickener

---

Game features character development.

Either the main character or a secondary character must grow or change as the game progresses. This can be because of the addition of abilities as long as they're thematically relevant and fit in your overarching story but can also be shown entirely via

the story and not expressed in gameplay. Any character that starts as one person and ends as another will get you this achievement.

### Did the Research

---

Research the theme and write at least a page on your findings.

Every major game that explores some concept of the real world will have to do research on the facts. Whether it's Assassin's Creed, Civilization, or Call of Duty, there will always need to be some work done before development to ensure that everything is historically accurate, physically accurate, and relevant to the chosen theme and story. The page should be at least 500 words with at least two sources. This is challenging, but very worthwhile for your game!

### Guiding Light

---

Create a reference guide (manual) to the story, background, or characters present in the game of at least one page.

For example, you might have a picture, a table of stats, and the backstory listed for all of the main characters in one little booklet; you could also have a few paragraphs in a booklet that talk through the story; finally, you could show an image and give some quick facts about all of your environments/levels, again in a booklet format.

### With Style

---

Create a style guide for your game of at least a page. Should detail elements such as visual style and mood.

A style guide is an important part of any major project. This will encompass many aspects of your game including programming standards, mood/voice, and artistic styles. The basic principle of a style guide is to allow a new team member to have a single document for reference. If your recruit is trying to write dialog for a character, the style guide should tell them what voice to use and what type of character they are. If the new member is trying to program, there should be information on naming conventions and where to put curly braces. The document should be written with no assumption of any knowledge on the part of the reader and should encompass the entire game. This will probably require most members on your team to write a little bit about what they're doing! If you need more information on style guides, Valve has a character style guide from Dota 2 available: <http://bit.ly/2hCTtgz>. Note that this example does not cover anything other than character design so we would be looking for a more broad

document than this, but it should give a pretty good idea of the types of things to include.

Easel

---

Create a storyboard and written description of at least one scene or screen in the game.

A storyboard is another very important part of your design process and story development. A storyboard helps you plan how a scene looks, who moves where, and what part of the story are revealed. The description should talk about what is happening, and why the scene is important. Like with many things, you can go online and find many examples of storyboards if you're having trouble thinking of what to do.

# PROFESSIONALISM

## Standard

### Clockwinding

---

Show off meeting minutes or other notes regarding team decisions.

Big projects often require lots of meetings. A good meeting starts with a list of things to accomplish (the agenda) and ends with notes to keep track of what actually happened (the minutes). If someone missed a meeting, they should be able to look at these minutes to catch up. Meeting minutes are also a great way to track the history of a project. For this achievement, have someone keep minutes (or better yet, rotate who takes notes) and bring these along for the judges to see. If your team doesn't keep formal minutes, you can also just bring any notes that show the discussions you've had about decisions for the game.

### Resonance

---

Describe how two or more team members worked together on a single task.

Teamwork is a beautiful thing! Think about times that your team members worked together on the same thing to get work done. It could be two programmers troubleshooting together, two artists collaborating on the same asset, or any other example of helping each other out.

### Dissonance

---

Describe how your team resolved a conflict or disagreement.

Even the best teams don't always agree on everything. Was there a disagreement over art or music style, which game engine to use, or the way the story unfolds? Did you flip a coin? Did you have a debate? Be prepared to talk about one of these disagreements and how you worked it out.

### Chorus of Voices

---

Every team member speaks when showing the game to the judges.

When it comes time to talk to the judges, the best way to demonstrate that it was a team effort is to have everyone talk about what they did. Make sure each team member is

ready to talk about their role, their title (if you used them), what they contributed, and how they helped make the team the well-oiled engine it is.

## Exhibit A

Show off your game and team at your booth using visual aids such as a slideshow or posterboard.

Your booth is just a table until you get setup. Teams should use their table to create an eye-catching display for their game. Stand out with a posterboard with some details about your team and/or your game. Consider a digital photo frame with a slideshow of your team working through the season.

## 13th Floor

Give the game's elevator pitch (convince people to buy your game in ~30 seconds).

In the business world, the best way to get the right people to listen to your idea is to be able to summarize your idea and communicate it quickly. Your elevator pitch is your quick summary of your game in thirty seconds or less. Imagine you are stuck in an elevator with a big-time game producer. This might be your only chance to make a great impression. Don't just try to talk about your game quickly, or you will sound rushed as you try to squeeze in every detail. Practice explaining your game with just the right amount of detail. "Space Duck is a side-scrolling exploration game where you have to find all the parts to repair a crashed space ship so the hero can return home." Don't try to explain every character or detail – there are other achievements for that.

## Team Spirit

Bring team business cards, banner, flyers, buttons, pamphlets or other promotional materials.

You don't have to spend much money to really bring the team spirit. You can paint or cut out a banner, you can design a brochure on the computer, and you can create nearly free business cards from sites like [www.vistaprint.com](http://www.vistaprint.com). Big shows like PAX and E3 are full of handouts to get people to notice the games. Screenshots, descriptions, team information, and your logo are all good things to add to your items.

## Dress for Success

---

Coordinate your team's dress on event day.

You know what looks cool? A whole team in matching outfits! It can be jeans and team t-shirts, or light dress pants with a dark shirt. You could even all dress up like characters in your game. You decide on your team's look and make sure everyone matches.

## Blogatog

---

- Have a development blog or social media page for your team.
- (Bonus) Update your blog or social media page once or twice per week for at least two weeks.

Your TMS page is great as your official download/details page, but you can really reach out to your fans with a blog, Facebook page, or other social media. Use your logos and pictures, and publish information about your team process. You could even use it to keep your meeting notes (minutes). Fans always love to see the process of how their favorite games are made.

(Bonus) Don't just create a blog or social media page and abandon it! Go back to it to post a new status or other details every few days. Don't let down your fans!

## Skynet

---

- Include team/game logos, team photos, and game screenshots on your TMS page
- (Bonus) Completely fill out your game page on TMS.

No game on Steam or Amazon would sell very well without all the details filled out. TMS has slots for team logo, game logo, team group photo, and game screenshots. Make sure you add logos/screenshots/images wherever there's space! Not only is it worth the achievement, our awards presentation gets generated directly from TMS so you don't want to be the team with "NO PICTURE" next to its name!

(Bonus) You've got space for pictures on TMS, but you can also upload your game or link to it so people can play it. It's so much fun to be able to play everyone else's game,

so make sure you give teams the chance to play yours. Fill out the game description and instructions, set the game engine and language, and make sure that you fill out everything. Use the “Edit Game Entry” in the upper-right of your game details page.

### Chirp

---

Make a post advertising your game on the official OGPC subreddit (<http://reddit.com/r/ogpc>).

Advertising works best when you get your message in front of as many people as possible. In addition to TMS, make a post on social media to announce your game. Include a screen shot if you can, and definitely link to your TMS page! You can also create a custom web site if that’s your thing.

## Extra Credit

### Giving Back

---

Publish an online tutorial about a problem you solved during development.

Think of how many times you got help by searching online for an article, Q&A, or video. Now it’s time for you to give back to the community! Think of something that was challenging to you during game development and make a video, article, or other online tutorial to help others. Be sure to have a good title, screenshots/video, and an explanation that will make sense for other people who have the same challenge.

### Media Mogul

---

Create and submit a press release for your game to online/print/online media.

Contact your local newspaper, TV/radio station, or other media to get some buzz for your team and game. Everyone loves to read about students have fun doing something cool, so make yourselves famous!

### Final Cut

---

Make a trailer for your game.

Do you drool over videos for the newest games on Steam and YouTube? It’s time to make your own! Capture some game play, add some titles, maybe even create a custom scene. Watch a few game trailers to see what you like about them, and then make something similar for your game. Some movie maker software even makes it easy to combine clips with music in different styles. Make sure to use music and voice clips that

you have permission to use (same rules as with the game). Even better, use your own content!

## Manifest

---

Create a physically crafted mascot for your game (plushy, sculpture, papercraft, etc.).

There are so many options to bring your game into the real world! Fold an origami character, use clay, stitch and stuff some fabric, or even 3d print one of your models. It's fun to see your game characters and items brought to life. Create, print, stitch, fold, whatever your items and make them part of your booth.

## Gold Calendar

---

Use agile development or a similar software development method during game development.

Project management isn't easy, but some tools make it easier. Agile development is a way of dividing your work into shorter periods called sprints. Use a Kanban board to sort your work items into ready, in progress, in review, and complete. Set dates to your work items and see how each item affects the other (Gantt Chart). Come up with some way to track your game project in software so you can see what you've done, what you've got left, and when you should be done.
